METHOD FOR MAPPING BUSINESS PROCESSES USING AN EMERGENT MODEL ON A COMPUTER NETWORK

ABSTRACT OF THE DISCLOSURE

5   Mapping business and engineering processes is accomplished by giving users access to a system for generating an emergent model and publishing inputs and/or outputs of models generated by the users. Published inputs and/or outputs of models generated are subscribed to by the users, thereby creating a network of linked inputs and/or outputs. The network of linked inputs and/or outputs are analyzed and displayed, 10   resulting in a map of the business and engineering processes. The models generated are used in business and engineering processes.
